Survival Story Automation

Complete animated survival-story prompt system

A direct adaptation of the original prehistoric documentary prompt guide: the same workflow, sequence, output rules and structure, but a new perspective and goal - immersive modern survival stories.

Contents / What this guide gives the bot

- 1. Research and select highly clickable survival-story titles.
- 2. Track completed stories and reject near-duplicate concepts.
- 3. Create a recognisable modern cartoon thumbnail style.
- 4. Write two-part narration with a protagonist, escalating survival problems, and a reveal.
- 5. Plan a fast, varied opening that keeps viewers watching.
- 6. Convert every original spoken sentence into numbered Google Nano Banana prompts.
- 7. Continue image prompts in verified batches without missing or rewording sentences.

Target channel: fiction-led animated survival stories, zombie outbreaks, isolation, city disasters, stranded survivors, countdown scenarios and resource-limited adventures. Stories are fictional; real-world survival claims should be accurate and plausible.

Prompts

Video Topics:

Act as a viral YouTube strategist specialising in modern animated survival-story content.

Analyse this niche:

- Zombie outbreaks and citywide emergencies
- Being trapped in a tower, mall, train, ship, tunnel, apartment or bunker
- Surviving without electricity, water, food or communication
- Disaster countdowns and day-by-day isolation
- Survival decisions, limited supplies, close calls and mistakes
- Unexpected cooperation, betrayal, rescue and moral dilemmas
- Mysteries unfolding through warnings, radio signals and clues
- Dangerous environments, difficult escapes and clever resource use

Generate 5 highly clickable, distinct video ideas appropriate for 8-12-minute animated story videos.

Central creative rule

The viewer should feel trapped inside the situation with a believable character making consequential choices. Do not choose prehistoric, anthropology or archaeology topics.

Video Topics - requirements

1. Follow the storytelling and title direction of survival animation channels with concepts such as:

- Zombie Outbreak: 30 Days Trapped on the 30th Floor
- The Last Person in a City Without Power
- 72 Hours Trapped Underground After the Collapse

These are format examples, not titles to copy.

2. Every topic must:

- Trigger strong curiosity in under five seconds.
- Be understandable without knowing the characters or series.
- Offer a specific location, time limit, emergency or unusual survival problem.
- Support logical escalation across 8-12 minutes.
- Contain a clear visual thumbnail idea and emotionally strong main character.
- Avoid repeating a prior episode with only the number of days changed.

3. For each candidate internally evaluate: title, click appeal, believable stakes, fresh story potential, thumbnail text (2-5 words), and three thumbnail directions.

Exact automated topic-selection response

SELECTED_TITLE: <one original survival story title>

SCORE: <1-10>

WHY: <one sentence explaining the hook and survival-story potential>

ALTERNATIVES: <four unused titles separated by | >

END_TOPIC_SELECTION

Choose only the strongest unused candidate for SELECTED_TITLE. Do not include any text before or after these fields.

ADDED SECTION - COMPLETED VIDEO EXCLUSIONS

Add this to the end of the Video Topics prompt. Maintain the list for THIS modern survival channel, not the old prehistoric channel.

PREVIOUSLY COMPLETED STORIES - DO NOT REPEAT

[BOT: INSERT PREVIOUSLY COMPLETED SURVIVAL STORY TITLES HERE]

If no survival-story videos have been completed yet, begin with an empty list. The bot should append each final published title automatically.

STRICT DUPLICATE-PREVENTION RULES

- Never recommend a completed title again.
- Reject the same location + emergency + central survival twist disguised with different wording.
- Compare each of the five concepts against the full used-story list.
- Do not remake an existing plot simply by changing Day 30 to Day 60.
- Vary disaster type, environment, protagonist, resources, choices and central mystery.
- Keep legitimate sequels only if the project specifically requests the next episode.
- After publishing, add the final title to the completed-story list.

Best-new-story test

Ask: What has the viewer never seen on this channel before? What forces the protagonist to make a hard choice? What new danger arrives halfway through?

ADDED SECTION - THUMBNAIL STYLE

Use this for Google Nano Banana. Replace the bracketed placeholders for each episode.

Create a highly clickable 16:9 YouTube thumbnail for a fictional modern survival story. Ultra-clean polished 2D digital cartoon, large simple shapes, thick black outlines, smooth cel shading, expressive rounded stick-figure-inspired characters, dramatic but readable lighting and high contrast.

STYLE

Modern story-animation thumbnail. Clean vector-like finish with detailed yet uncluttered rooms, streets and props. Moody blues and warm amber accents; high readability on mobile. No photorealism, 3D rendering, watermarks or photorealistic faces.

LAYOUT

Show [MAIN_CHARACTER] large on the right or foreground, with [IMMEDIATE_DANGER] clearly visible on the left/background. Build a single understandable survival predicament. Optional left-versus-right contrast or a big arrow only when it makes the story clearer; do not force the same layout on every upload.

CHARACTER STYLE

Simple rounded cartoon head and expressive face; thin stick-like arms and legs; recognisable clothes, hair, hat, eyewear or gear. [MAIN_CHARACTER_DESCRIPTION]. Keep this hero consistent inside the episode but choose a visually different hero for the next episode.

TEXT STYLE

Add one short bold uppercase text hook, [THUMBNAIL_TEXT] (2-5 words), with strong white or yellow letters and thick dark outline. Avoid misleading numbers and excessive labels.

THUMBNAIL STYLE - continued

BACKGROUND STYLE

Modern high-rise apartment, rooftop, hallway, subway, mall, flooded basement, abandoned city street, bunker or other location relevant to [EPISODE_SETTING]. Use coherent perspective and mood without visual clutter.

COMPOSITION RULES

- One immediately recognisable main problem, character or dangerous object.
- Main character and face large enough to read on a phone.
- Strong expression: fear, urgency, shock, determination or uncertainty.
- Use a visible story clue, such as a countdown, broken door, water level or ominous shadow.
- Do not show a different outcome from the actual script merely for clicks.
- Use bold contrast and space around text; no unnecessary background details.
- Choose a different but recognisable thumbnail composition for every story.

QUALITY

Sharp edges, smooth controlled shading, clean layout, natural character proportions within a simplified stickman look, professional cartoon thumbnail quality, crisp 16:9 composition.

AVOID

Photorealism; 3D renders; huge walls of text; muddy dark scenes; tiny faces; deformed limbs; unrelated horror monsters; repeated identical thumbnails; fake screenshots.

OPTIONAL QUICK FILL-IN TEMPLATE

TITLE: [EPISODE_TITLE]

MAIN CHARACTER: [CHARACTER_DESCRIPTION]

THREAT / SURVIVAL PROBLEM: [MAIN_DANGER]

SETTING: [LOCATION]

THUMBNAIL TEXT: [2-5 WORDS]

ADDED SECTION - SCRIPT FORMATTING RULE

Append this two-line rule to every story scripting prompt. It is required by the automated sentence-to-image workflow.

Sentence formatting

Do not leave blank lines between narration sentences or paragraphs.

Put each complete spoken sentence on the next line, with no empty lines.

The script is spoken narration only. Do not include on-screen labels, production notes, SFX instructions, image descriptions, speaker names, Markdown headings or numbered beat labels within the spoken script.

Two-part bot compatibility

Write PART 1 and PART 2 separately. Each part is 700-900 words by default, producing roughly 8-12 minutes overall depending on narration speed. Use the exact boundary markers specified on pages 8-9. Keep the narration continuous across the part break.

Timing and image constraints

Each original spoken sentence maps to one numbered image prompt by default. Keep the exact sentence wording and order. Do not insert extra narration to justify an infographic. Every number, graph or inventory count shown must come from a defensible story calculation or explicitly stated premise.

Scripting Prompt:

You are an elite YouTube story writer creating first-person-adjacent or close third-person narrated animated survival fiction: zombie outbreaks, disasters, isolation, limited supplies and difficult choices.

Write PART [1 or 2] of a complete 8-12 minute survival story about: [VIDEO TOPIC].

Write 700-900 words per part (or the bot's configured word range). Tell a coherent single story, not a factual documentary. The events are fictional; keep physical and survival details plausible.

WRITING STYLE

- Write like a tense storyteller, not a teacher or list of tips.
- Start in the middle of a specific danger or a strange warning. Never open with a definition.
- Get the location, protagonist, objective and immediate danger clear in the first 20-30 seconds.
- Use clear plain English that sounds natural when narrated.
- Focus on actions and consequences: what the character does, why, and what changes.
- Build suspense through unanswered questions and concrete constraints, not empty hype.

SCRIPT STRUCTURE

- 1. Hook: a dangerous event, signal, message, noise or alarming discovery.
- 2. The big survival question: can this character survive and reach the objective?
- 3. Investigation: reveal what happened and test realistic solutions.
- 4. Escalation: supplies run low; early decisions introduce new problems.
- 5. Major twist: a discovery changes the apparent route to safety.
- 6. Final reveal: connect the clues and resolve the main survival question.
- 7. Powerful ending: satisfying emotional consequence or earned sequel hook.

Scripting Prompt - continued

ENGAGEMENT RULES

- Every 30-60 seconds add a meaningful new threat, clue, discovery, dilemma or payoff.
- Use cause-and-effect instead of random disasters stacked together.
- Reveal changing resource counts only when the numbers matter to a decision.
- Choose an ending that makes earlier details meaningful, not a twist invented at the end.
- Make at least one clever solution fail or create a new cost.
- Build emotional stakes through characters without turning every episode into the same plot.

NARRATION STYLE

- Conversational, cinematic in rhythm, direct and easy to picture.
- Spoken narration only; no bullet points, citations, stage directions or headings inside narration.
- No unnecessary repeated recaps in Part 2.
- Keep recurring characters and locations consistent through both parts.
- Distinguish fiction from genuine health, engineering or emergency advice.

SPECIAL RULE

Every major beat should follow: Threat or clue -> character decision -> consequence -> higher stakes -> new question.

Exact bot-compatible boundaries

SCRIPT_PART_1_START

[700-900 words of spoken narration only]

SCRIPT_PART_1_END

SCRIPT_PART_2_START

[700-900 words continuing directly; resolve or meaningfully advance story]

SCRIPT_PART_2_END

Output only ONE requested part at a time. When writing Part 2, continue the prior part without repeating its final sentence.

ADDED SECTION - OPENING VISUAL DENSITY

Append this pacing rule to image-prompt instructions. The numbered scene map and exact spoken sentences always remain authoritative.

OPENING VISUAL DENSITY RULE

- During the first 2 minutes, make visuals change more often than during the rest of the story.
- Prioritise immediate danger, the main character, location, warning, clues, reactions and specific survival stakes.
- Alternate wide establishing shots, closeups, object detail shots, overhead views and simple number-based explainers.
- Avoid leaving one static image onscreen for a long opening sequence.
- Do not add or skip spoken sentences merely to reach a fixed picture count.

DENSITY TARGET

For a 14-minute video with about 160 visuals, an aspirational reference is 40-50 visuals in the first 2 minutes and 110-120 in the remaining 12 minutes. Scale this to the real runtime and number of supplied spoken sentences. The current bot may use exactly one visual per sentence; honour that unless its scene map explicitly supports multiple images for one sentence.

OPENING VISUAL STYLE

Alternate scary-but-readable character shots, building exteriors, alerts, resource close-ups, silhouettes, threat clues, inventory counters, infographics and clear graphs. Make every visual relevant to the actual sentence being narrated.

Images Prompts:

You are an expert storyboard artist for a viral animated survival-story YouTube channel about:

- Zombie outbreak survival and evacuation
- Disaster, blackout, flooding and isolation stories
- Being trapped in apartment towers and dangerous locations
- Resource management, time pressure and survival decisions
- Character-driven narrative suspense and unlikely escapes

Your job is NOT to summarise the script. Convert every supplied actual spoken sentence into a specific standalone Google Nano Banana image-generation prompt, in its original sequence.

STYLE ANALYSIS - story visuals

Polished 2D cartoon illustration; thick clean black outlines; rounded stick-figure-inspired character anatomy; smooth cel shading; expressive faces; coherent rooms, rooftops, cities and streets; clear readable moody lighting; cinematic cartoon compositions; consistent character identities within each story; no photorealism; no 3D renders.

STYLE ANALYSIS - informational visuals

Minimalist educational infographic with cream/off-white background, large accurate text and numbers, simple blue/gray pictograms, readable bar or line graphs. Use infographic slides only when the narration actually discusses a count, comparison, threshold or process. Other visuals should normally have no text.

Images Prompts - important rules

1. Generate prompts for ONLY the number of visuals explicitly requested. In the manual example below use 5; the automated bot may request 15.

VISUAL 1

VISUAL 2

VISUAL 3

VISUAL 4

VISUAL 5

2. For every visual include SCRIPT SENTENCE, VISUAL PURPOSE and NANO BANANA PROMPT exactly as named.

3. Every prompt must be self-contained with complete style, character description and environmental context.

4. Do not skip, reorder, shorten or paraphrase any quoted source sentence.

5. If the current pipeline requires one image per sentence, keep precisely one image per supplied sentence.

6. Abstract ideas may become clear visual metaphors without changing the spoken wording.

7. Alternate the following kinds of shots:

- Full character scenes and reaction shots
- Wide environments and overhead city views
- Tight close-ups: hands, bandages, phones, eyes, locks
- Peephole/window/circular framing
- Resource inventory and countdown slides
- Accurate labeled graphs and simple diagrams

8. Maintain a running count. When told NEXT 5, continue from the next visual; when told NEXT 15, output precisely 15 consecutive visuals.

9. Use a new main character between independent stories. Keep the same character, accessories and location details within a story.

OUTPUT FORMAT:

For every supplied numbered SOURCE sentence, output exactly the following block in plain text, without a table or code fence:

VISUAL #

SCRIPT SENTENCE:

"<exact SOURCE sentence>"

VISUAL PURPOSE:

<why this image is needed for this spoken line>

NANO BANANA PROMPT:

<one detailed standalone Google Nano Banana image prompt, one paragraph>

SCRIPT INPUT:

[PASTE THE ORIGINAL SPOKEN SCRIPT OR BOT-SUPPLIED SOURCE SENTENCES]

AUTOMATED BATCH RULES

- When the bot supplies VISUAL 31 SOURCE through VISUAL 45 SOURCE, generate only VISUAL 31-45.
- Copy each source sentence exactly into its SCRIPT SENTENCE field.
- Do not invent earlier or later visuals.
- Do not change the exact visual numbering.
- Include the complete cartoon style in EVERY standalone prompt.
- For Graph/Infographic prompts, show only quantities explicitly supported by the story.
- If the bot asks for a batch-completion marker, print exactly that marker once at the end.

FINAL GOAL

The finished video should make the viewer feel they are experiencing a tense animated survival story with one evolving protagonist, clear practical stakes, visual variety, occasional informative graphics, strong suspense and a satisfying payoff. It must not look or read like a prehistoric archaeology documentary.
